

The eNanoMapper Ontology

An application ontology to enable data integration for nanomaterial risk assessment

 - B. Ontology Development Kit
 - Comparison

Overview

① Introduction

- eNanoMapper
- Engineered nanomaterials and safety
- Ontologies

② eNanoMapper Ontology

③ Migrating the eNM ontology CI/CD

eNanoMapper

- ▶ **eNanoMapper** is a broader project which aims to address data and model interoperability challenges for engineered nanomaterial safety. [1]
- ▶ **The eNanoMapper ontology** is an application ontology and reuses parts of several ontologies to describe the full domain of nanomaterial safety assessment. [2]

Figure 1: The eNanoMapper logo

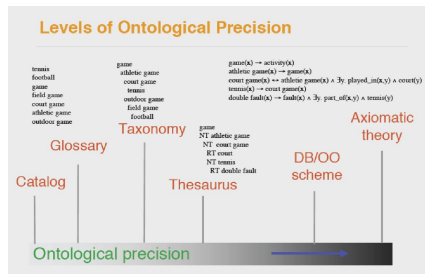

Engineered nanomaterials and safety

- ▶ Engineered nanomaterials (eNMs) are broadly defined as compounds that exist on a scale of 1–100 nm. in at least one of their dimensions. [2]
- ▶ Their safety assessment must cover the identification of:
 - Physicochemical properties
 - Biological properties and activity [1]
 - Diffusion behaviour into the natural environment [2]

Ontologies

- ▶ A formal representation of a set of concepts within a knowledge domain which can be used to a) define such domain; and b) reason about its properties [3]
- ▶ It consists of three syntactical categories: **Entities**, **Expressions** and **Axioms**, which can be given annotations for further description. [4]

Figure 2: An ontology is not just a glossary or vocabulary. Axioms constrain, disambiguate and overall provide semantic richness.

Ontologies

- All entities (classes, object properties, named individuals...) are uniquely identified by a sequence of characters called IRI.

Figure 3: An owl:Class in an ontology text file (the ontology document). IRIs in blue.

```
<!-- http://purl.obolibrary.org/obo/PATO_0001464 -->

<owl:Class rdf:about="http://purl.obolibrary.org/obo/PATO_0001464">
  <rdfs:subClassOf rdf:resource="http://purl.obolibrary.org/obo/PATO_0001018"/><rdfs:subClassOf
  rdf:resource="http://purl.obolibrary.org/obo/BFO_0000016"/>
  <obo:IAO_0000115 rdf:datatype="http://www.w3.org/2001/XMLSchema#string">A quality that is equal to the
  potential energy per unit charge associated with a static (time-invariant) electric field, also called the electrostatic
  potential.</obo:IAO_0000115>
  <oboInOwl:hasOBONamespace rdf:datatype="http://www.w3.org/2001/XMLSchema#string
  ">quality</oboInOwl:hasOBONamespace>
  <oboInOwl:id rdf:datatype="http://www.w3.org/2001/XMLSchema#string">PATO:0001464</oboInOwl:id>
  <oboInOwl:inSubset rdf:resource="http://purl.obolibrary.org/obo/pato#attribute_slim"/><oboInOwl:inSubset
  rdf:resource="http://purl.obolibrary.org/obo/pato#scalar_slim"/>
  <rdfs:label rdf:datatype="http://www.w3.org/2001/XMLSchema#string">electric potential</rdfs:label>
</owl:Class>
```

Ontologies

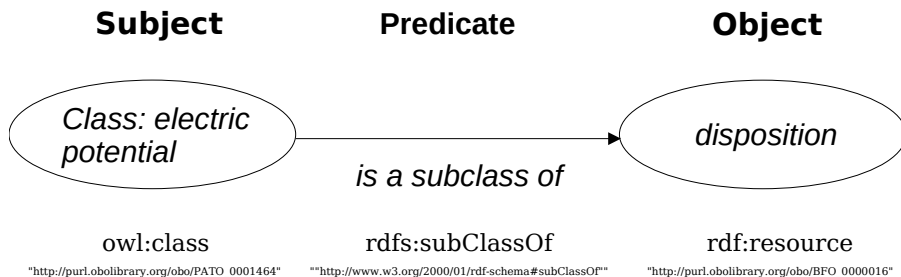

- ▶ Most ontologies use the W3C standard language for ontologies, Web Ontology Language **OWL**.
- ▶ OWL ontologies are mainly stored in .owl files, which are a sort of **RDF** document.
- ▶ **RDF** (Resource Description Framework) is a standard for data exchange. It defines **triples** of (**subject**, **predicate**, **object**). [5]
- ▶ These triples form labeled graphs where the edge (predicate) represents the link between two resources (subject and object)

Figure 4: The pizza ontology, visualized as a graph [6]

Ontologies

Figure 5: A graph with two nodes (Subject and Object) and a triple connecting them (Predicate): the class with class description "electric potential" is a subclass of disposition.

Ontologies

Figure 6: The triple in the previous figure as expressed in the .owl document file of the ontology it is contained in.

```
<!-- http://purl.obolibrary.org/obo/PATO_0001464 -->  
  
<owl:Class rdf:about="http://purl.obolibrary.org/obo/PATO_0001464">  
<rdfs:subClassOf rdf:resource="http://purl.obolibrary.org/obo/BFO_0000016"/>  
  
(...)  
</owl:Class>
```

Ontologies

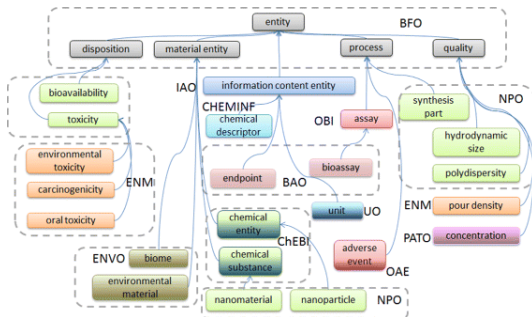

- ▶ **Foundation/Upper/Top-level ontologies**
- ▶ **Application and domain ontologies**

Overview

- 1 Introduction
- 2 eNanoMapper Ontology
 - Design of the eNanoMapper ontology
- 3 Migrating the eNM ontology CI/CD

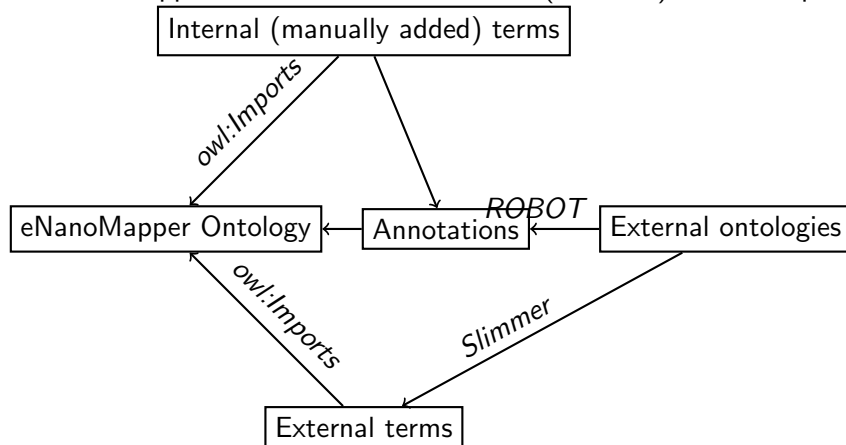

Design of the eNanoMapper ontology

Figure 7: An overview of the upper levels, imports and manually annotated content going into the eNanoMapper ontology [2]

Design of the eNanoMapper ontology

The current approach uses in-house software (*Slimmer*) to slim imports.

Design of the eNanoMapper ontology

Figure 8: The current Jenkins setup for eNanoMapper ontology CI/CD

The screenshot shows the Jenkins web interface for the 'eNanoMapper Ontology' project. The top navigation bar includes 'Dashboard', 'eNanoMapper', and 'eNanoMapper Ontology'. The main content area is titled 'Project eNanoMapper Ontology' and features a 'Recent Changes' section with a code icon and a 'Downstream Projects' list. The 'Downstream Projects' list includes various ontology mappings such as 'Wikipathways - ChEBI', 'eNanoMapper - AOP', 'eNanoMapper - BAO', 'eNanoMapper - BAO - properties', 'eNanoMapper - BFO', 'eNanoMapper - BFO - properties', 'eNanoMapper - CCNT', 'eNanoMapper - ChEBI', 'eNanoMapper - CHEMINF', 'eNanoMapper - CHMO', 'eNanoMapper - CLO', 'eNanoMapper - CTO - properties', 'eNanoMapper - GFO', 'eNanoMapper - ENVO', 'eNanoMapper - FAO', 'eNanoMapper - GO', 'eNanoMapper - HUPSON', 'eNanoMapper - IAO', 'eNanoMapper - NFO', 'eNanoMapper - NFO - properties', 'eNanoMapper - OAE', 'eNanoMapper - OBCS', 'eNanoMapper - OH', 'eNanoMapper - PATO', 'eNanoMapper - RDO - properties', 'eNanoMapper - SDO', 'eNanoMapper - SDO - properties', 'eNanoMapper - UBERON', 'eNanoMapper - UO', and 'eNanoMapper - CHEMINF - properties'. On the left sidebar, there is a 'Build History' section with a search bar and a list of recent builds, each with a status icon (green for success, red for failure) and a timestamp.

Overview

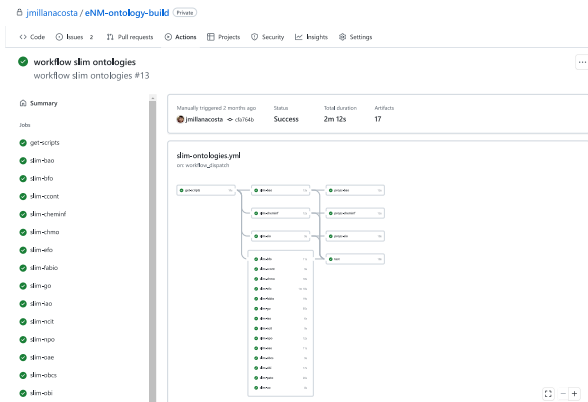

- ① Introduction
- ② eNanoMapper Ontology
- ③ Migrating the eNM ontology CI/CD
 - Migrating the ontology development
 - A. Migrating current setup to GitHub actions
 - B. Ontology Development Kit
 - Comparison

Migrating the ontology development

- ▶ Current setup: Jenkins for CI in own server (to be dropped soon)
- ▶ Alternatives:
 - Literal migration from Jenkins to GitHub actions (ref figure)
 - Migration to the Ontology Development Kit-ROBOT - rethinking the whole process(ref figure)

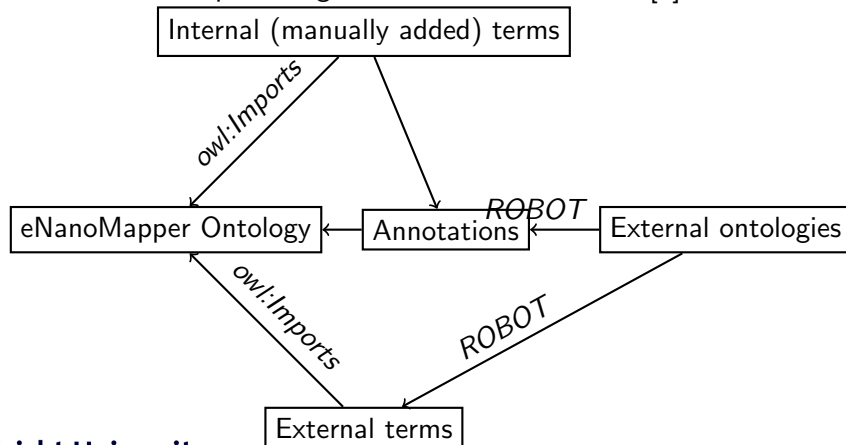

A. Migrating current setup to GitHub actions

Figure 9: A test run for the GitHub actions-based setup for eNanoMapper ontology CI

B. Ontology Development Kit

The ODK approach relies on ROBOT to handle ontologies and serialization of several steps through standardized Makefiles. [7]

B. Ontology Development Kit

- ▶ A toolkit developed for the development of biomedical ontologies following the software development approach (a method preceded by the eNanoMapper/jenkins/Slimmer setup)
- ▶ It is delivered in a docker image and uses ROBOT (a wrapper for the OWL API) and a series of scripts to standardize and automate steps like preparing ontology releases, continuous quality control checking, and dependency management. [8]

Figure 10: The ODK logo

B. Ontology Development Kit

The challenge: replicating the same class hierarchies after substituting Slimmer with ROBOT.

Comparison

Table 1: Comparison of the two alternatives for eNanoMapper CI/CD

	GitHub actions	Ontology Development Kit
Uses tools	GH actions, slimmer, maybe ROBOT for annotations, in-house scripts	ROBOT and ODK scripts
Keeps current class hierarchy	Yes	Perhaps, but will be a challenge
Sticks to OBO recommendations	Yes, after minimal adaptations if Slimmer is kept	Yes
Hosted on	GitHub	GitHub
Time to develop	Ready at any point	Not optimal for migrating existing ontologies [7]
